

Satisfaction with smoking, and smoking reduction, during pre-quit treatment with nicotine patch or varenicline

Stuart Ferguson
University of Tasmania

BREATHE WELL

- SGF:
 - Has worked as a consultant for GSK & Chrono Therapeutic
 - Served on an advisory board for Johnson & Johnson
 - Has received travel funding from Pfizer
 - Study funding from Rusan Pharma
- Chappell has nothing to declare.

- This work was supported by researcher-initiated project grant funding from Pfizer (through the GRAND initiative; awarded to Ferguson)
- Additional funding was provided the Royal Hobart Hospital Research Foundation (awarded to Ferguson)

Improving the odds of success

- Outcomes of existing mono-therapies is disappointing
 - >60% of supported quit attempts fail
- Advances can come from improving current methods
- Understanding how methods works may suggest improvements to use

Rational for patch preloading

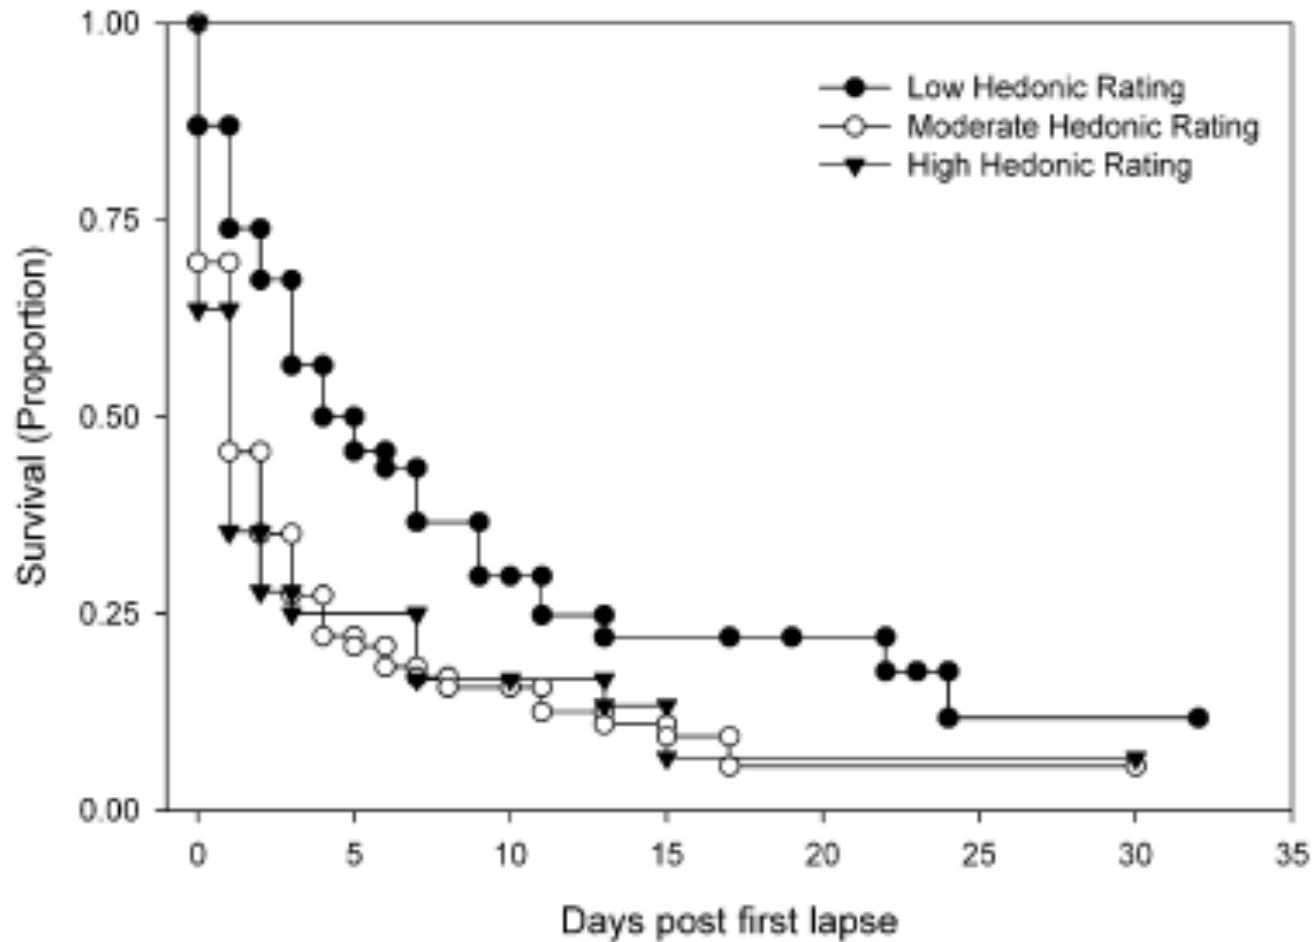

- Dissociate nicotine levels from smoking
 - Reduce reinforcement
 - Satisfaction → Reduced Smoking → Cessation

Rational for patch preloading

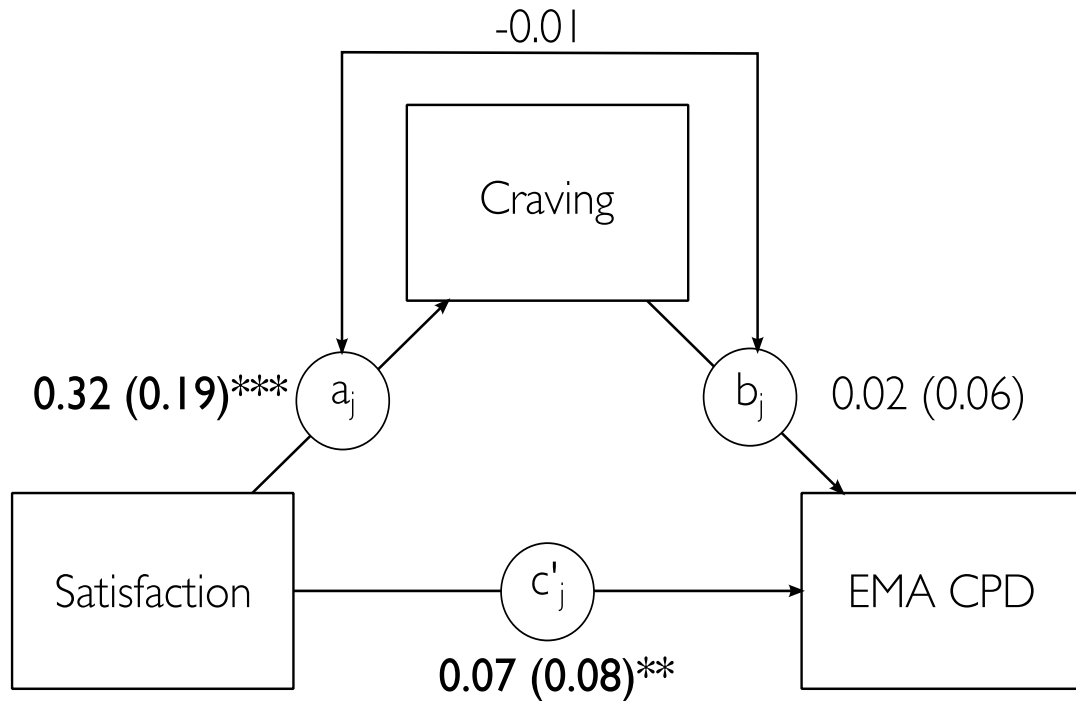

- Dissociate nicotine levels from smoking
 - Reduce reinforcement
 - **Satisfaction** → **Reduced Smoking** → Cessation

Satisfaction with a lapse predicts relapse

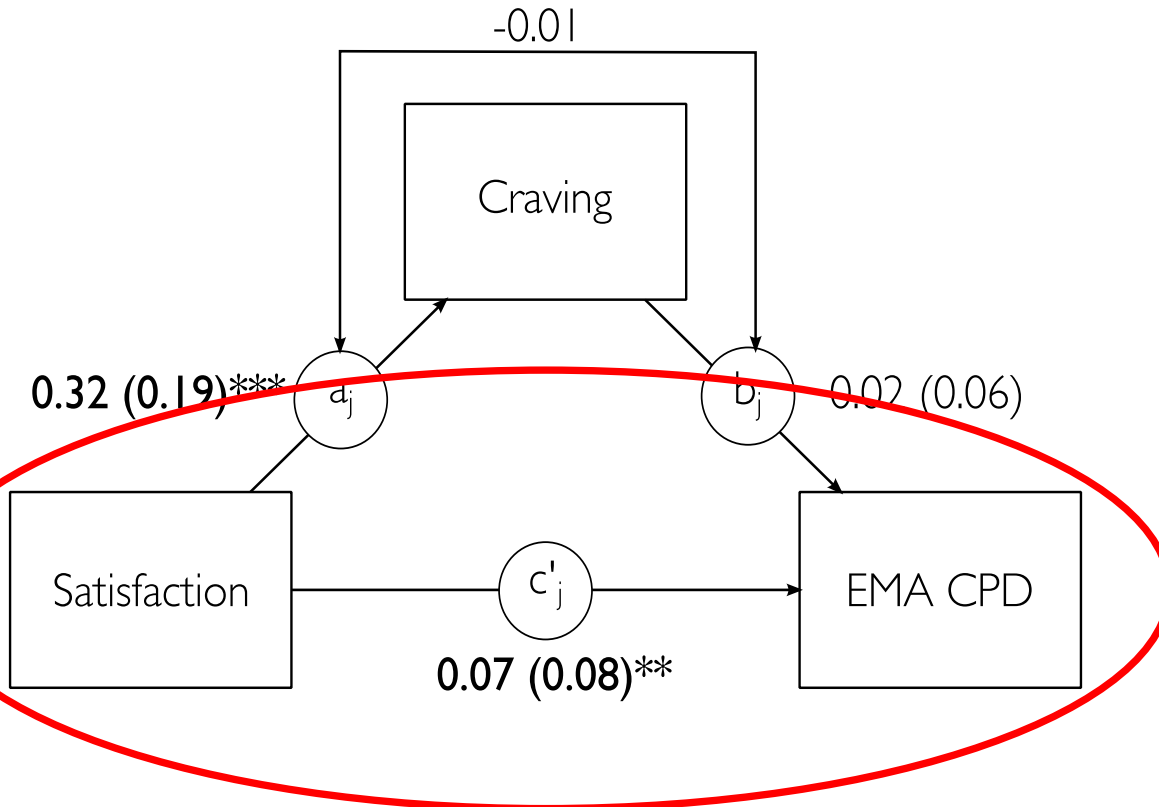

Satisfaction with smoking predicts daily smoking rate: Single-group pilot study

Schüz & Ferguson 2014

Satisfaction with smoking predicts daily smoking rate: Single-group pilot study

- During pre-quit patch treatment, satisfaction with smoking predicts daily smoking rate
- Due to treatment?

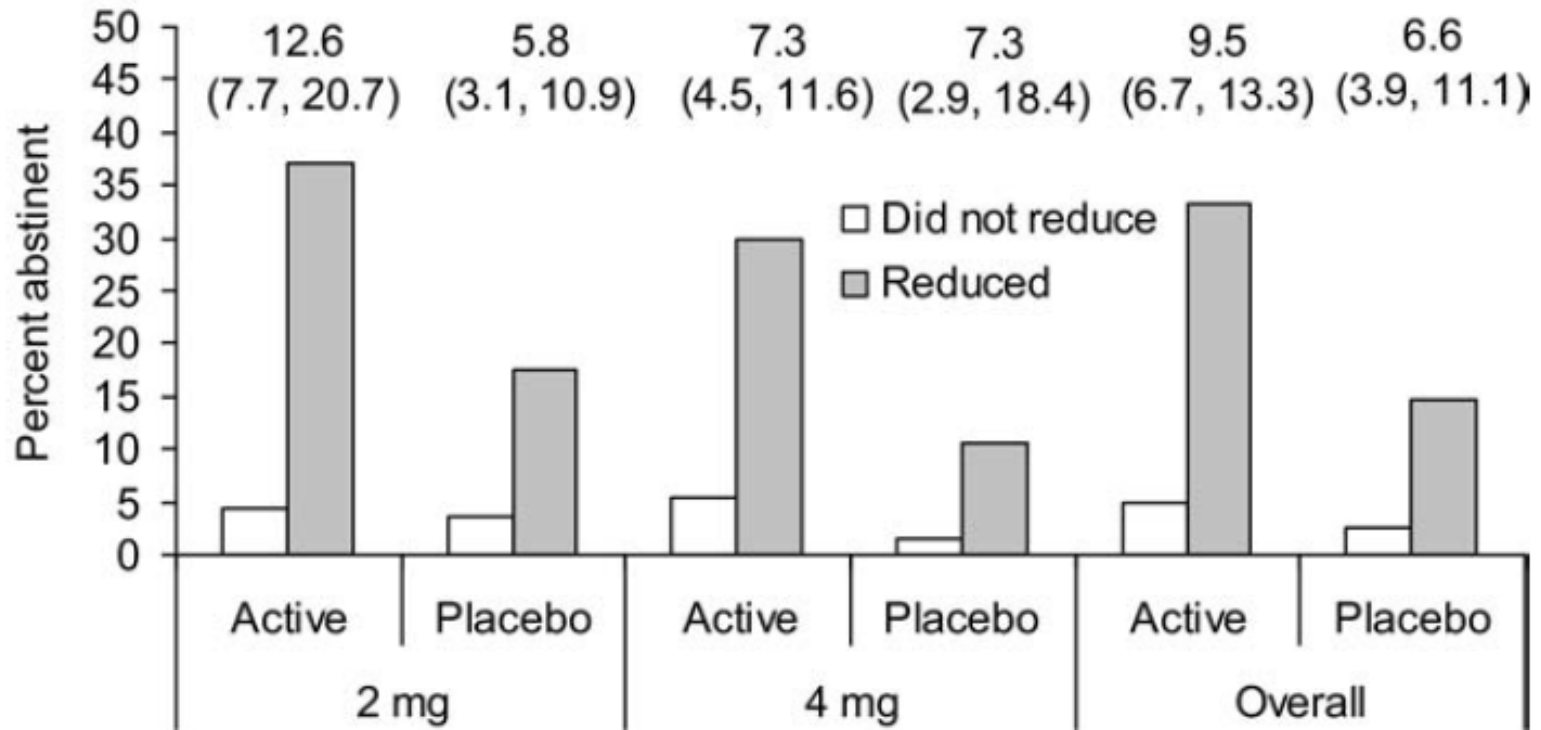

Schüz & Ferguson 2014

Rational for patch preloading

- Dissociate nicotine levels from smoking
 - Reduce reinforcement
 - Satisfaction → **Reduced Smoking** → **Cessation**

Reduction promotes abstinence

28 day abstinence; Shiffman, Ferguson & Strahs (2009)

Rational for patch preloading

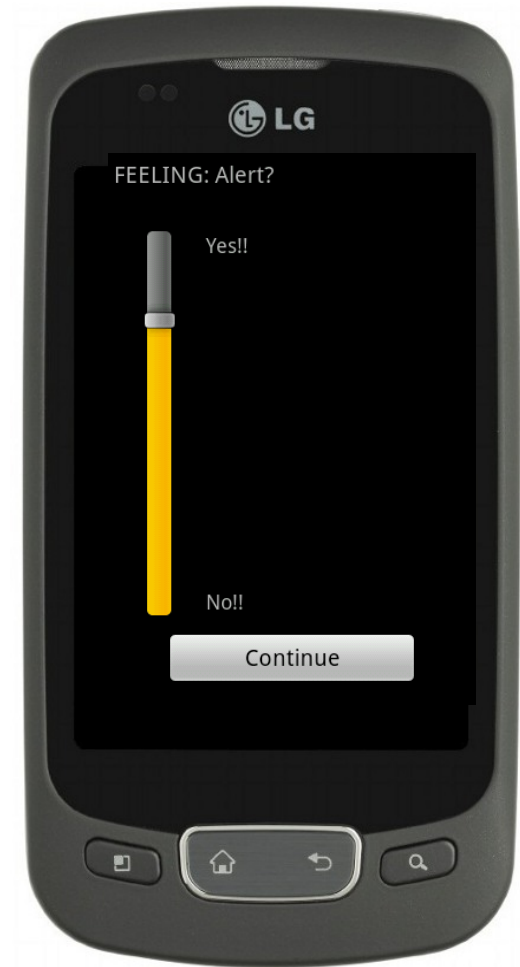

- Dissociate nicotine levels from smoking
 - Reduce reinforcement
 - Satisfaction → Reduced Smoking → Cessation
- Similar mechanism proposed for varenicline
- Potentially explains lack of effect for gum preloading
- Opportunity of tailoring?
- Target of new treatments?

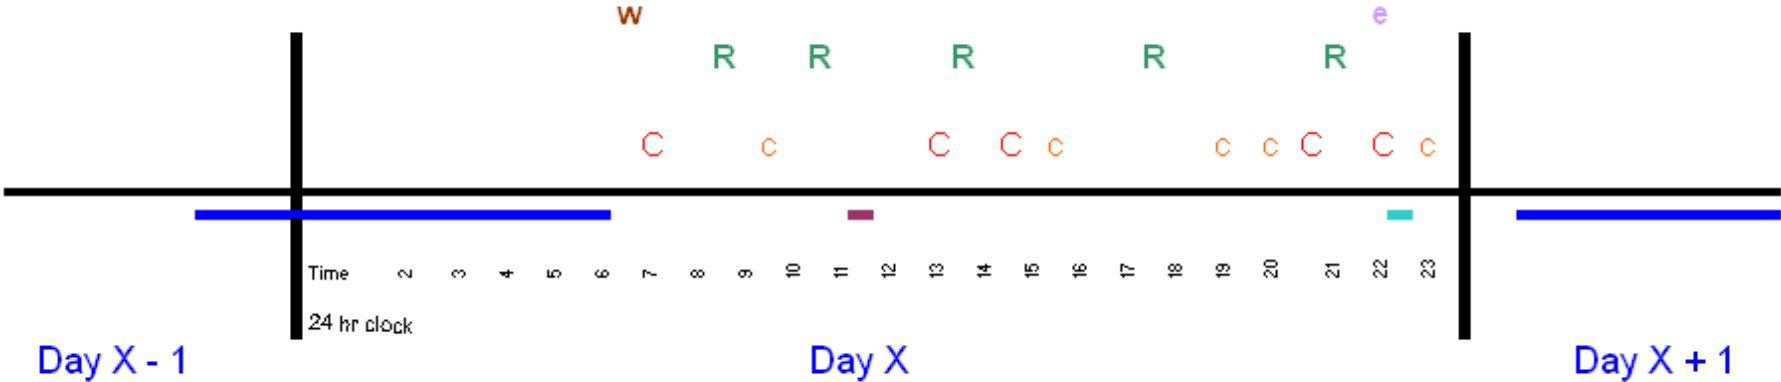

- Test effect of pre-quit treatment on satisfaction with smoking and daily smoking
 - Larger sample
 - Control condition (no pre-quit treatment)
 - Varenicline
- H: Effect of pre-quit treatment on reduction will be mediated via satisfaction with smoking
 - Opportunity for tailoring treatment

- Three group, open-label RTC
 - Pre-quit Patch (PQP; n=72)
 - Varenicline (VAR; n=72)
 - Standard Patch (SP; n=69)
- Intensive, real-time monitoring (EMA)
 - 2wks before & 2wks after TQD
 - CPD, satisfaction, withdrawal & craving

EMA Monitoring Protocol

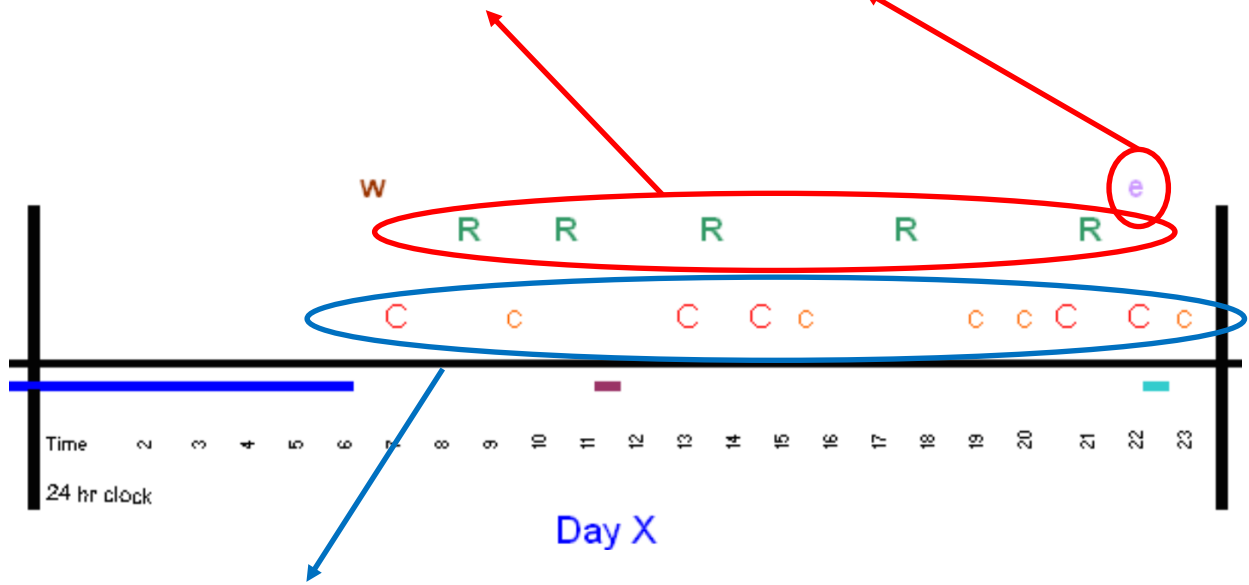

Protocol continues at all hours, adapts to subjects' day

LEGEND

R Randomly scheduled assessment	<u>Intervals free from random 'beeps'</u>
C Cigarette with assessment	Suspended prompting
c Cigarette with no assessment	Nap
w Wake-up assessment	Sleep
e Evening assessment	

- Symptom severity & satisfaction w smoking

- Daily cigarette counts (w TLFB)

- 5 lab visits: TLFB, NNAL, CO, COT
- **Focus: Pre-quit treatment period**
- Full Protocol:
 - BMC Public Health, 2015. doi:
10.1186/s12889-015-2596-2
 - ACTRN12614000329662

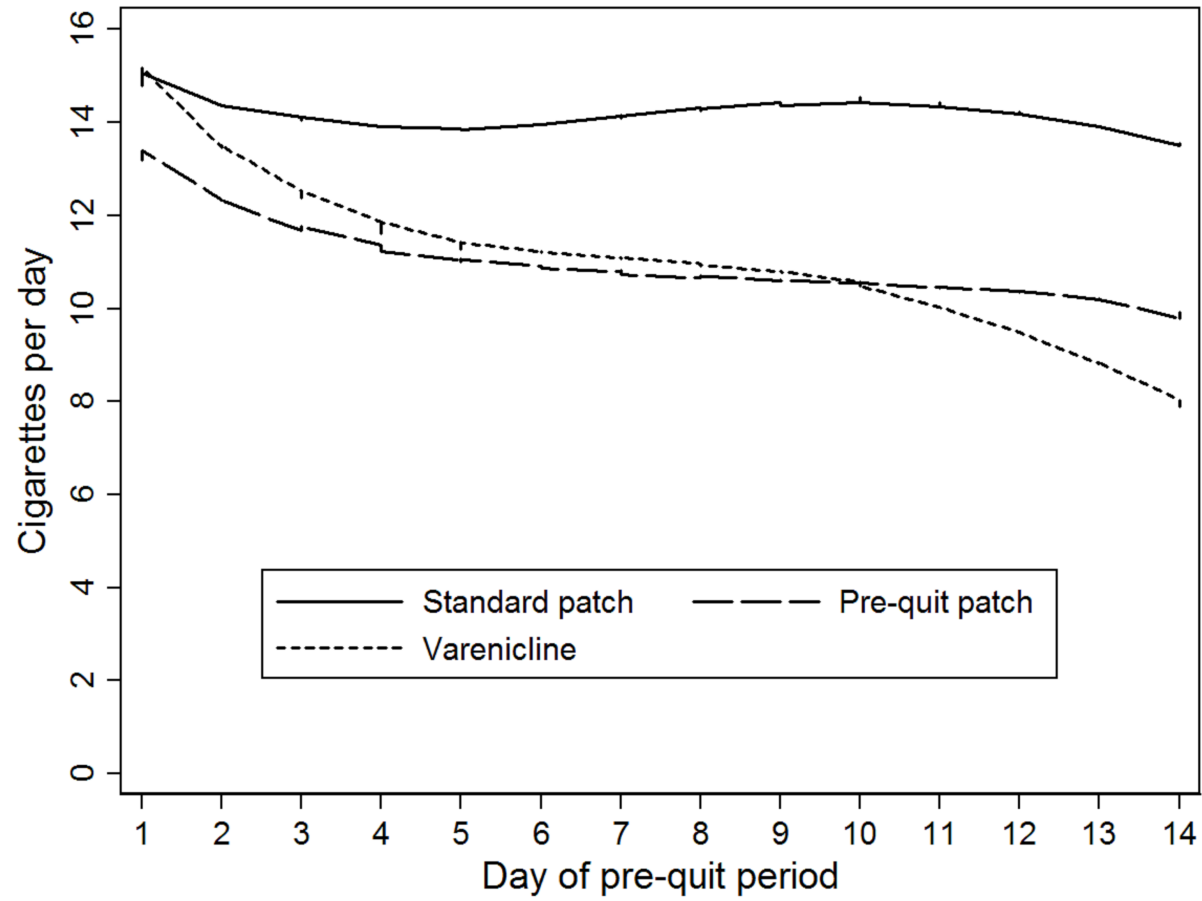

PQT Study: Sample

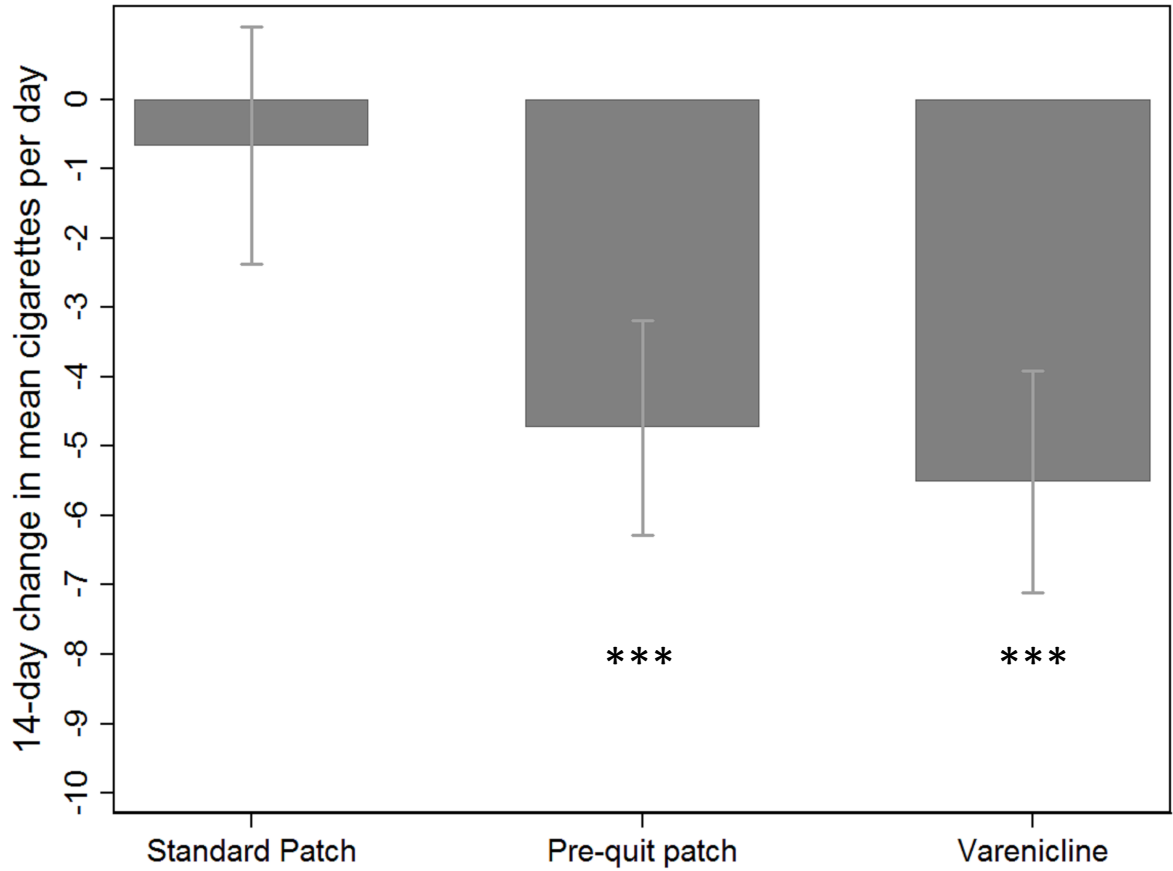

- N = 213
- Predominately Caucasian (92%) males (58%)
- ~42 years old
- Moderately heavy smokers
 - ~19 CPD
 - 74% TTFC \leq 30mins
 - Baseline CO = 21ppm

Pre-quit treatment promoted smoking reduction

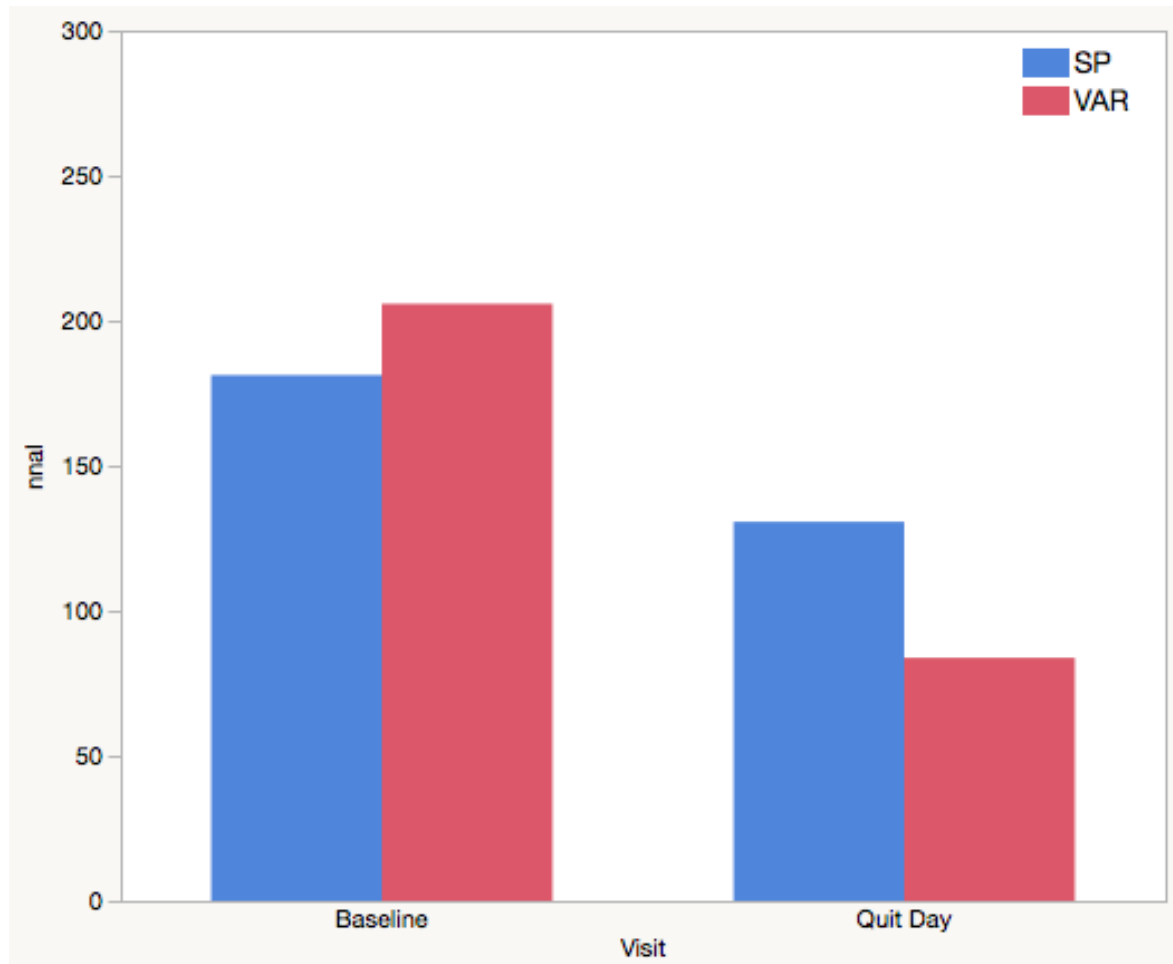

- During the pre-quit period
 - PQP & VAR groups reduced their smoking
 - SP did not

Pre-quit treatment promoted smoking reduction

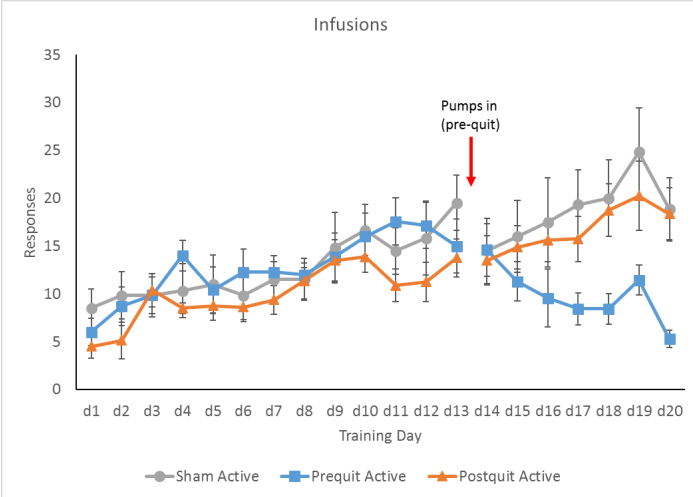

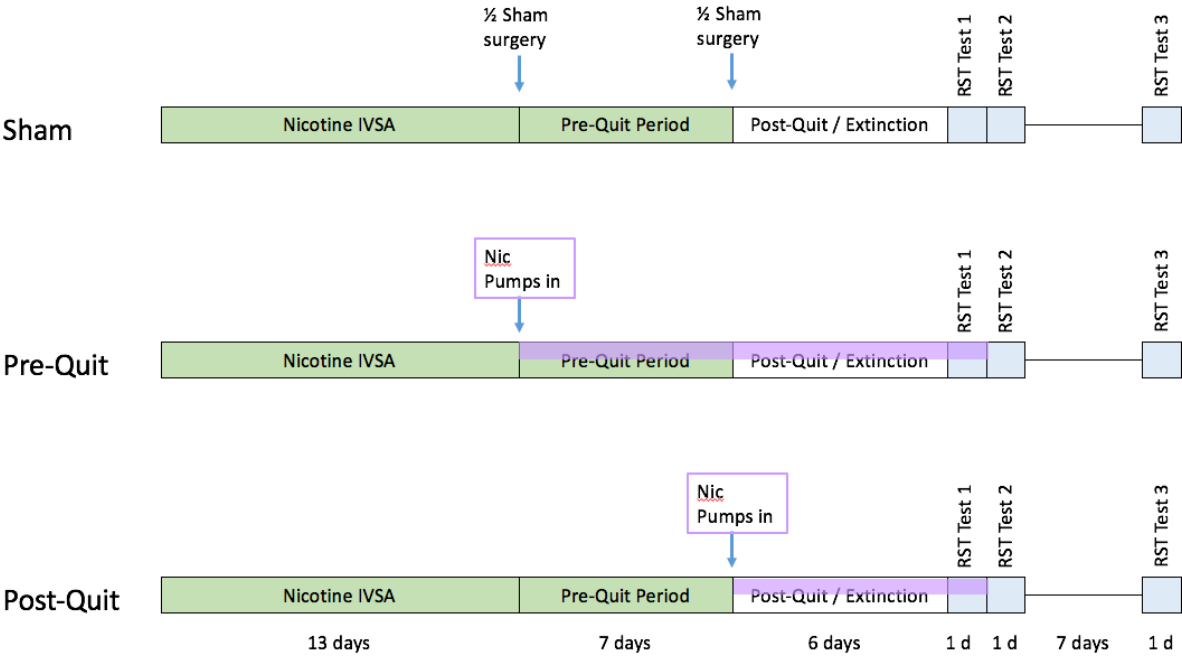

- PQP group reduced by ~6 CPD on average
- VAR group by ~7 CPD
- SP: no change

Biochemical markers confirmed self-reported smoking reduction

- Decline in NNAL levels steeper in VAR group (compared to SP)

See similar self-administration patterns in animal studies

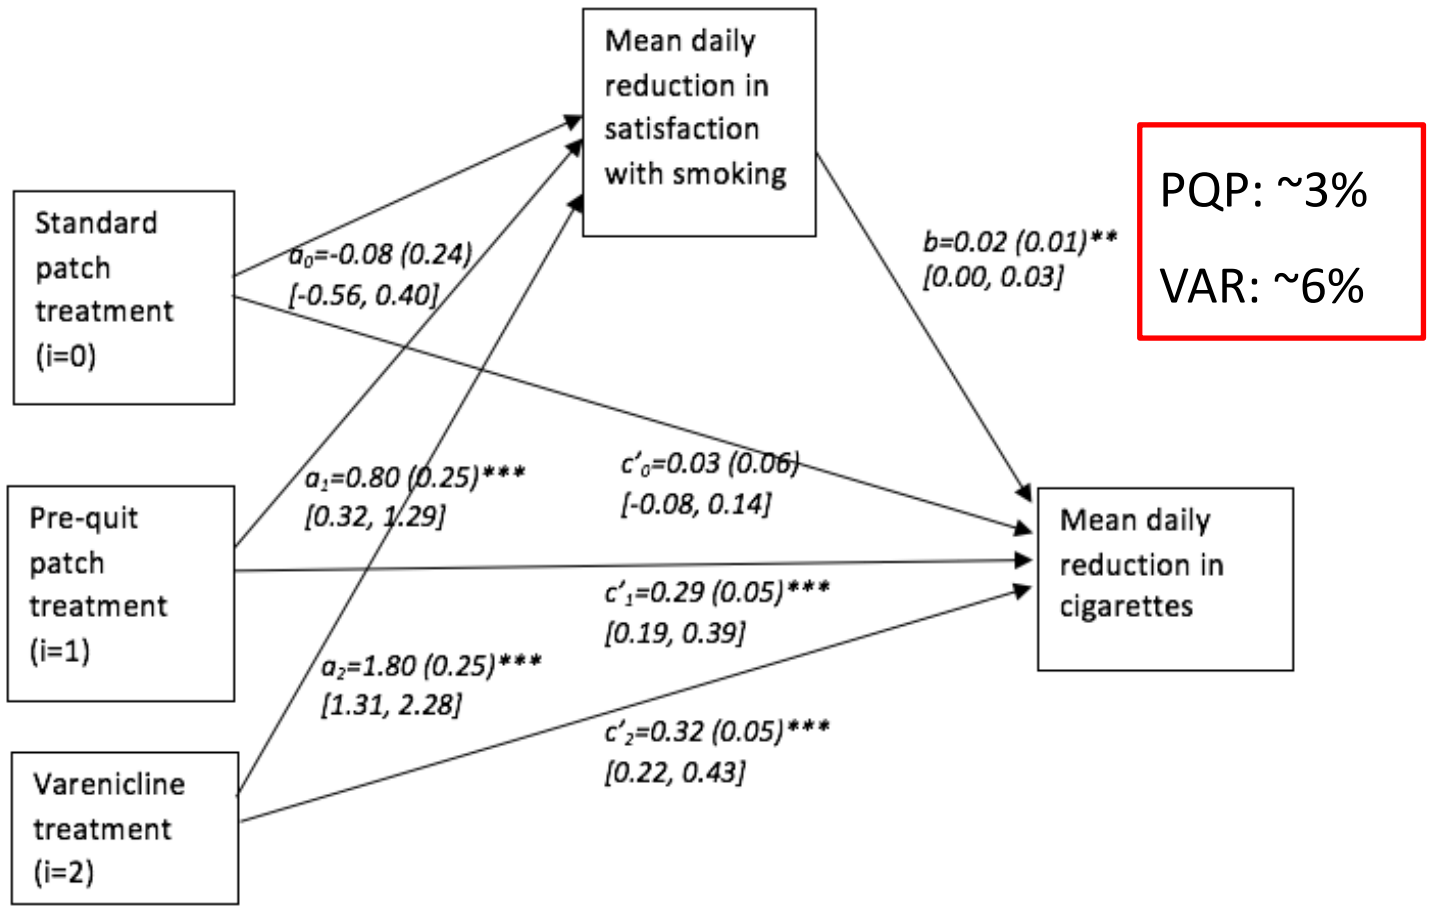

Unpublished data

Change in satisfaction with smoking during pre-quit period, by group

- During the pre-quit period satisfaction w smoking
 - Fell in PQP & VAR groups
 - Stable in SP group

Satisfaction with smoking does mediate the effect of treatment on CPD ... but it's weak

- VAR & PQP pre-quit treatment does result in
 - Reduced satisfaction with smoking
 - Reduced CPD
- Effect of pre-quit treatment on reduction is only partially mediated via satisfaction with smoking
 - Other drivers of reduction
 - Changes in stimulus control?
- Understand of mechanism of action may improve outcomes with pre-quit medication use
