Executive Summary

In March 2020, 793 employees of University of Tasmania (UTAS) completed the Sustainability Culture Indicator (SCI).

The purpose of the survey was to get a better understanding of attitudes toward sustainability, and what factors are both helping and hindering staff to achieve sustainability outcomes within the University.

The survey is built around the enablers of a culture of sustainability, both individual (psychological and attitudinal elements) and organisational (support mechanisms). By assessing the extent to which those enablers are present in UTAS, it is possible to better prioritise and target activities to embed sustainability in the culture.

This is the third time the survey has been conducted, following surveys in 2016 and 2018.

Results

The 2020 results showed an impressive increase from those of 2018. All thirteen enablers of a culture of sustainability increased in 2020 – twelve of these to a statistically significant extent. UTAS also scored above the average for the tertiary sector for eleven of these enablers.

The perception of the university’s overall effort towards sustainability also increased significantly from two years ago, showing a steady upward trend over the four years the survey has been undertaken.

Factors which showed particularly strong increases were those relating to perceived support for sustainability. Staff feel like their managers and peers more strongly support sustainable action, and that leaders better walk the talk on sustainability.

In terms of self-reported sustainability-related behaviours, the frequency was slightly lower than in 2018, although generally on a par with other universities.

Written comments were largely encouraging of UTAS’s sustainability efforts. There is strong support for continued advocacy for sustainability, including divestment from fossil fuels. Transport is also a strong focus, with many respondents urging the university to take measures to curb transport impact, both locally and on a larger scale.

In summary, almost all aspects of the survey showed a strong upward trend in UTAS’s sustainability efforts. Staff in particular feel that leadership and management support for sustainability has improved in recent years. Continued efforts to align the organisation’s processes and facilities with sustainability, along with ongoing engagement and education efforts, should see UTAS continue to embed sustainability in the organisational culture.
Key Findings

Highlights

• All enabler items increased compared to the 2018 survey
• Perceived effort towards sustainability significantly increased since 2018
• UTAS exceeds the university average on 11 of the 13 enablers of a culture of sustainability
• Large increases in the extent to which people feel supported by their leaders, managers and peers in sustainability efforts

Potential areas to address

• Frequency of sustainability-related behaviours decreased slightly overall
• The perception of the extent to which facilities support sustainability is below that of other universities
• Making the link between job responsibilities and sustainability is lower than the tertiary comparison group

©Awake 2020
The chart above shows the mean scores for each of the enablers measured in the SCI. Scores can range from 1 to 6.

The **individual enablers** are the psychological and attitudinal factors which need to be in place in order for employees in the organisation to engage in sustainable behaviours. For instance, if people feel strong responsibility towards sustainability, but perceive they have limited control over the sustainability aspects of their job, they are unlikely to engage in pro-sustainability actions.

The **organisational enablers** are those aspects of the organisation which support a culture of sustainability. For instance, if people perceive that the rewards and recognition system fails to reinforce a sustainability focus (e.g. by focusing only on short-term revenue and profit), then this may present a barrier to the organisation’s sustainability vision.

All enablers are broken down in detail on pages 40-52.
Comparison with 2018 Survey

The chart above compares UTAS’s mean enabler scores to those recorded in the exact same survey in 2018.

About these results

UTAS in 2020 scored higher for all the enablers, compared to 2 years ago. This demonstrates that the university’s efforts are being recognised by staff and resulting in a stronger culture of sustainability being embedded.

All these increases are statistically significant (p<.01) with the exception of Beliefs About Sustainability.
The chart above compares UTAS’s mean enabler scores to those of nine other universities who have completed the SCI. It should be noted that the survey items completed by the comparison universities differ slightly in some places, due to ongoing development and customisation of the SCI.

About these results

UTAS exceeded the university average on all but two enablers, with the exceptions being Job Responsibilities and Facilities. This indicates that UTAS has embedded sustainability within its culture very favourably compared to other universities, particularly in the areas of leadership and strategic commitment.
Comparison With Other Organisations

The chart above compares UTAS’s mean enabler scores to those of other organisations who have completed the SCI. It should be noted that the survey items completed by the comparison organisations differ slightly in some places, due to ongoing development and customisation of the SCI.

These comparison organisations are a mix of corporations (25%), local government (40%) and universities (35%). Approximately 80% of the organisations are based in Australia-New Zealand, as the SCI was developed in this region.

About these results

These results show that UTAS scored somewhat below the average of other organisations for each of the enablers, with the exception of Beliefs About Sustainability and Responsibility for Sustainability.

This indicates that sustainability is not quite as well embedded in the culture of UTAS as it is in the other organisations, on average, although the personal orientation of employees towards sustainability is on a par with the comparison group. As an overall observation, tertiary institutions tend to score lower on average than organisations in other sectors.

Overall Sustainability Effort

“UTAS's current level of effort with regard to sustainability is...”

Overall, the rating of UTAS’s effort with regard to sustainability has increased to 5.92 out of 10, up from 5.47 in 2018. This easily exceeds the mean for other universities, while still below that for other organisations.

The University's current level of effort with regard to sustainability is...
(mean score = 5.92)
Overall, behaviours at work have stayed steady in comparison to 2018. The reported frequency is similar to those in other universities and organisations, although shutting down of computers continues to lag behind those comparison groups.
Outside work, people report regular actions relating to waste and conservation in particular, comparing favourably to those in the comparison groups. There was a slight decrease in most behaviours compared to the 2018 survey.

### About these results

The table above shows the relationship between behaviours and enablers, ranked by strength of the correlation. Enablers with a high correlation are strongly related to behaviours, although not necessarily causal.

The results show that the key correlates of sustainability-related behaviours are the individual enablers of the SCI, along with being clear about how job responsibilities relate to sustainability. Overall, all of the enablers had a significant relationship with behaviours at work.

These findings suggest that efforts to further embed sustainability in the culture of UTAS will benefit from continuing to demonstrate to people how their actions make a difference, and supporting and encouraging them to make sustainability a priority consideration in decisions and actions.
### Additional Items: Sustainability & Job Wellbeing Importance

</tbody>
</table>
I believe that sustainability is relevant across all areas of the curriculum.

I think it is important for the university to be certified carbon neutral.
I support the University publicly acknowledging the climate emergency and committing to initiatives in response (mean = 4.51 from 5)

I support the University working towards elimination of fossil fuel-based and/or single-use plastics on campus (mean = 4.63 from 5)
Additional Items: SDGs and carbon neutrality

The internationally supported Sustainable Development Goals (SDGs) are relevant to my studies and future employment (mean = 3.99 from 5)

Since 2016, the University has been certified carbon neutral. The University should maintain this certification (mean = 4.66 from 5)
The University divested all direct investments in fossil fuel-related companies in December 2018. It is important to me that the University divest all funds from such companies (mean = 4.49 from 5)

Incorporating the natural environment into buildings is important to me (mean = 4.46 from 5)
The University's Strategic Framework for Sustainability is sufficiently comprehensive to reflect the broad approaches needed to become a sustainable university (mean = 3.62 from 5)
Individual Enabler: Beliefs About Sustainability

Definition

People’s beliefs about the importance of sustainability and the priority which organisations should give it.

For more resources for this enabler, including research findings and strategies for improvement, go to www.awake.com.au/beliefs

Importance Of This Factor

If people believe that sustainability is important, and should be made a priority by individuals and organisations, they are more likely to engage in and support sustainable behaviours.

Your Organisation’s Results

These results show that staff continue to hold the belief that sustainability is something that UTAS should invest in and should make a priority. This belief is more prevalent than in 2018.
Individual Enabler: Responsibility for Sustainability

Importance Of This Factor

Feeling like sustainability is important to them personally, and being willing to make it a priority in their actions, is an essential determinant of people engaging in sustainable behaviours.

Your Organisation’s Results

The results show that there has been a sizeable increase in the extent to which UTAS staff feel a strong responsibility for sustainability, and the mean for these items is now comfortably above the average for the comparison groups.
Individual Enabler: Sustainability Knowledge

Importance Of This Factor

If people do not have good awareness of the sustainability issues relevant to their organisation and their job, it is difficult for them to engage in, and contribute to, the organisation’s sustainability objectives. Research repeatedly reveals that knowledge of sustainability issues is an essential precursor to pro-environmental behaviour, while a recent study of organisations found that internal awareness-raising campaigns were among the most effective ways of encouraging employees to adopt green behaviours.

Your Organisation’s Results

Sustainability knowledge has risen since 2018 and compares favourably to the average for the comparison groups. The scores still suggest there is room for improvement in education and awareness-raising around sustainability, a sentiment which was reinforced by the written comments.
Individual Enabler: Perceived Support

Definition
The level of support people feel they have to act sustainably, from their peers and manager.

For more resources for this enabler, including research findings and strategies for improvement, go to www.awake.com.au/support

Importance Of This Factor
If people feel that there is strong support from those around them to make sustainability a priority, they are more likely to do so, and feel like they can innovate and take risks in doing so.

Your Organisation’s Results
Support items enjoyed among the biggest increases in 2018 and show that people feel they are reinforced for sustainability more strongly than in previous years. This consistency of support would appear a strong contributor to the overall sense that sustainability is becoming more strongly embedded in the organisational culture.
Importance Of This Factor

A strong precursor to sustainable behaviour is the perception that we have some control over our actions, and that those actions will have a beneficial outcome.

Your Organisation’s Results

People are feeling a stronger sense of control about sustainability. Although the mean for the top item above is low (which is normal for most organisations), increments in the sense of empowerment should have an influence on the adoption of sustainability efforts.
Organisational Enabler: Strategic Commitment

Importance Of This Factor
An organisation which makes a clear commitment to sustainability and communicates it strongly provides the clarity and confidence people need in order to make it a priority in their decisions and actions.

Your Organisation’s Results
Strategic commitment was the highest scoring organisational enabler and well above 2018. This points to a continuing sense that UTAS is leading the way in sustainability and in turn should translate to stronger employee commitment. There is still room for improvement in communicating of these commitments. Several written comments expressed pleasant surprise in hearing about the initiatives UTAS has undertaken, such as committing to carbon neutrality.
Organisational Enabler: Sustainability Leadership

Importance Of This Factor

All aspects of culture are driven from above, including sustainability. If people feel that there is strong leadership commitment, and the behaviours of the leaders and managers are consistent with this commitment, then a culture of sustainability is more likely to be created. This is supported by research findings, which reveal that the best sustainability-focused organisations are typified by strong leadership in the area.

Your Organisation’s Results

Sustainability Leadership increased significantly since 2018. Staff feel that UTAS leaders are more clearly demonstrating a commitment to sustainability with the mean now above the university average on all items. There is room for improvement, especially in managers role modelling sustainability.

Definition

The extent to which the leadership and management behaviours in the organisation support a culture of sustainability.

For more resources for this enabler, including research findings and strategies for improvement, go to www.awake.com.au/sustainability_leadership
Importance Of This Factor

Organisations with a strong culture of sustainability are those that promote and encourage it. The extent to which this has been prevalent and effective has a big impact on the success of efforts to embed sustainability in the culture.

Your Organisation’s Results

The increase in these items suggest that staff are seeing more visible efforts to promote sustainability. The written comments urge continued efforts in this regard, in order to further reinforce the importance of sustainability.
Organisational Enabler: Innovation

**Importance Of This Factor**

Sustainability is strongly linked to innovation, given that it requires new ideas and ways of doing business. An organisation with a strong culture of innovation is in a better position to embrace the opportunities presented by the greater emphasis placed on sustainability by business and communities.

**Your Organisation’s Results**

Innovation is another enabler which rose above the university average in 2020. Ensuring that new ideas for sustainability are encouraged and supported can be a great driver for both efficiency and staff engagement.

**Definition**

The level of support people feel they have to try new ideas to enhance sustainability.

For more resources for this enabler, including research findings and strategies for improvement, go to [www.awake.com.au/innovation](http://www.awake.com.au/innovation).

**Range of Responses: Innovation**

(Rounded: Mean = 3.46)
Organisational Enabler: Job Responsibilities

Importance Of This Factor

People need to be clear about the degree to which sustainability is related to their job. If they believe it is the role of the environment department or green team, it is unlikely that sustainability will be strongly embedded in the culture.

Your Organisation’s Results

Staff feel clearer about sustainability as it relates to their role, although there is still plenty of room for improvement. Those who scored highly on these items were more likely to report frequent sustainability-related behaviours (see Correlations p33). Action could be further encouraged through job specification design, discussions at performance reviews, and opportunities to review sustainability as it relates to individuals.

Definition

The level of clarity people have regarding the way in which sustainability relates to their job.

Organisational Enabler: Rewards and Recognition

Importance Of This Factor

Rewards and recognition systems need to be designed in such a way that the desired behaviour is encouraged. If people are rewarded for sustainable behaviours, it is more likely that they will undertake them – the opposite is also true.

Your Organisation’s Results

Rewards and recognition scored lowest among the enablers, which is not an unusual result – very few organisations have sustainability aligned strongly in this regard. The scores for UTAS rose above both the university average and 2018 result.

This enabler was also correlated highly with sustainability-related behaviours (see Correlations p33), indicating that people who feel they are rewarded for actions are more likely to take them.
Organisational Enabler: Processes

Importance Of This Factor
When systems and processes are aligned with sustainability goals, it is more likely that these goals will be achieved. This provides clarity and certainty for people, and make it easy to do the right thing.

Your Organisation’s Results
Processes at UTAS showed an increase from 2018 and rose above the university average. Written responses suggested that people see room for improvement in aligning processes with sustainability goals, especially with regard to paperless systems and teaching policies.
Organisational Enabler: Facilities

Definition
The degree to which people feel the physical environment and facilities in the workplace support sustainable behaviours.

For more resources for this enabler, including research findings and strategies for improvement, go to www.awake.com.au/facilities

Importance Of This Factor
Behaviour is strongly influenced by one’s physical surroundings. If a workplace is designed in such a way as to make sustainable behaviours easy and unsustainable behaviours difficult, the former are more likely to prevail. This includes making sustainable options the default (e.g. double-sided printing), and clear directions for sustainable behaviours (e.g. waste disposal).

Your Organisation’s Results
The score for this enabler increased since 2018. Many written comments refer to the energy efficiency of buildings and the provision of transport services as key ways in which sustainability could be better supported in the physical infrastructure.
What is the biggest change you could PERSONALLY make in order to decrease the environmental impact of your direct work activities?

(see appendix document "All written comments” for full comments)
"What is the main thing stopping you from taking that action?"

(see appendix document "All written comments" for full comments)
"What is the most important change the University could make in order to operate in a more sustainable way?"

(see appendix document "All written comments" for full comments)
